

COPPER LOCKER

Copper Lockers stop potential thieves before they get to first base by replacing the existing cover on an in-ground Type 1, Type 2 or Type 3 pull boxes.

Patent No: US 9,890,566 B1

Copper Locker DE 1000 is designed to replace the existing cover on an in-ground pull box and can simply be ordered with the pull box on new projects. We have elected to make the DE 1000 series COPPER LOCKER from 3/16" stainless steel, welded and formed with a 3/16" C channel backer plate, giving it the distinction of being traffic rated.

It is cam driven with a two point locking system ensuring no access without pin retraction from the box. The DE 1000 series Copper Locker also incorporates the shackleless lock which blocks the path to the cam bolt, making access virtually impossible for would-be thieves. The DE 1000 Copper Lockers are made out of stainless steel for harsher environments. All of the DE 1000 Copper Lockers can be made to fit almost any manufactured concrete or concrete composite box.
